DETAILED ACTION

Claim Rejections - 35 USC § 101

35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claims 1-10 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

The claims are directed to a judicial exception; as such, pursuant to the Interim Guidelines on Patent Eligible Subject Matter (MPEP 2106), the claims must have either physical transformation and/or a useful, concrete and tangible result. The claims fail to include transformation from one physical state to another. Although, the claims appear useful and concrete, there does not appear to be a tangible result claimed. Merely converting a desired lens design to a geometry of a contact lens would not appear to be sufficient to constitute a tangible result, since the outcome of the projecting points onto a surface of a lens design and generating a semi-meridian steps have not been used in a disclosed practical application nor claimed as made available in such a manner that its usefulness in a disclosed practical application can be realized. As such, the subject matter of the claims is not patent eligible.

Allowable Subject Matter

Claims 11-20 are allowed.

The following is a statement of reasons for the indication of allowable subject matter: The prior art does not teach or suggest a method of producing a contact lens by providing a lens design of a contact lens having a central axis, an anterior surface and an opposite posterior surface, projecting a predetermined number of points within a predetermined tolerance onto a surface of the lens design along each of a number of evenly-spaced semi-diameter spokes, each spoke radiating outwardly from the central axis, for each of the spokes, generating a semi-meridian which is continuous in first derivative and includes a series of arcs and optionally straight lines, where each arc is defined by fitting at least three consecutive points into a spherical mathematical function, where each of the straight lines is obtained by connecting at least three consecutive points, generating a data file containing information about the geometry of the lens in a form that is interpretable [should read "interpreted"] by a computer-controlled manufacturing device and producing the contact lens or a molding tool for making the contact lens using the computer-controlled manufacturing device (independent claim 11).

Note the above correction that should be made to independent claim 11 in any response to this action. Also note, these claims are considered allowable, since there is a concrete tangible result.
